

ABSTRACT

The invention relates to an antenna system comprising a first type
5 of antenna (10) and second and third antennas (11,12) of a second type. The first to third antennas (10 -12) are slots which are excited by longitudinal radiation and are placed on the same edge of the same substrate. The first antenna (10) is placed between the second and third antennas (11,12). This system is particularly suitable for integration in a PCMCIA card.
